Brass 90° Standard Connector/
Adapter for C02

#V012
Brass 90° Schrader Valve
Extension

Valve Connectors/Extensions must be removed from wheel valve after use. Do not leave connected during operation of the vehicle.

Detailed Cargol Information

What is a Cargol?

Cargol Turn & Go System is made by Grypp Line of Barcelona, Spain.

Cargols are items designed for emergency puncture repair of tubeless tires.

Cargols come in two versions. The Black Cargol is available for cars, motorcycles, and scooters; the Grey Cargol is made for trail bikes, quad, and ATVs.

Each Cargol is made with a combination of polypropylene and fibers.

Remember, Cargol provides an Emergency Repair only. Have your tires examined by a professional for replacement or permanent repair at your earliest opportunity.

How does it work?

The 5-step design helical screw and toric ring located at the top ensure that the puncture is safely sealed. Its tip, with an angle of 17 °, makes it easy to insert and the wide grip handle enables you to screw the Cargol clockwise until the hole is plugged. Then just snap off the handle!

Having been introduced by the spiral thread-ring, it does not erode the tire and therefore has not increased the diameter of the hole.

Remember, Cargol provides an Emergency Repair only.

How can I find the hole?

If you are repairing the puncture with our kit K004 or K005, use the chalk included to mark the exact spot where the object is before removing it.

If the object is not present, or you forgot to mark the spot before removing, do the following:

Use a CO2 canister found in any of our kits, and as air flows into the tire, pass the palm of your hand over the surface of the tire to feel where the air leaks out through the hole of the puncture. Then use Cargol to plug the hole and get to your dealer to get the tire repaired.

What if the Cargol protrudes?

After screwing in the Cargol to the puncture hole, the Cargol may protrude slightly from the tire. This may happen when the hole is very small. Once you start driving again, the weight of the vehicle will cause the Cargol to embed itself in the tire and the part that protrudes will be eliminated.

Is this a permanent repair?

The Cargol System is designed for emergency situations only. You are advised to not drive at speeds of more than 80 km/hour (50 MPH).

Have your tires examined by a professional for replacement or permanent repair at your earliest opportunity.

Can it damage the tire or rim?

Cargol contains no additional chemicals that may damage the tire or hinder subsequent repairs. Once you arrive at your local dealer, Cargol may be removed without difficulty.

What if it's a large hole?

Most punctures (road and off-road) under normal driving conditions, should not exceed 2mm. Cargol has been designed and tested to perform in these cases, with excellent results. In case of a cut in the tire or holes larger than 4mm, Cargol may not be sufficient for emergency repair. Two Cargols should not be used to repair a single puncture.

See the Grypp Emergency Tire Repair Kits - Rope Style for other puncture Repair.

How long do Cargols last?

Cargols can be used provided that they remain stored under normal conditions without being exposed to direct sunlight or extremely humid environments for long periods.

During tests on real vehicles for 3 months, 3600km for Cars and 2100km for Bikes, no erosion or wear and tear that could affect the emergency sealing function was observed.

Remember, Cargol provides an Emergency Repair only. Have your tires examined by a professional for replacement or permanent repair at your earliest opportunity.
